BASIC-ABSTRACT:

The semiconductor pressure detector consists of a circuit board (10). The circuit board consists of a pressure sensor (5). The pressure sensor produces an electrical signal depending on the pressure in side room. A bonding wire (12) and two pins for adjustment signal transfer terminal and a power transfer

terminal (2b, 2a) communicates signals between the pressure sense element and exterior. The whole arrangement constitutes signal transfer unit.

A connector housing (1) with an enclosure hole (1b) is provided to house the two pin terminals. The hole also encloses a liquid (13). The connector housing is sealed air tight with a main housing (3) using an air tight diaphragm. The main housing consists of pressure introduction hole (3b) which conveys the pressure from exterior to the liquid enclosed. Thus, the pressure from the exterior is conveyed to the liquid and sensed by pressure sensing element.

ADVANTAGE - Provides air tight sealing.
